

# Case Study

<b>Project Name</b>	Strategic Transport Projects Review (STPR) Support
<b>Model User</b>	Jacobs Consultancy
<b>Ultimate Client</b>	Transport Scotland
<b>Model Version</b>	TmFS:05a

## Project Summary

The STPR reviewed and prioritised the schemes and policies to be included in the Scottish Government's long-term capital investment programme for the strategic transport network.

The STPR outcomes are central to shaping the long-term future of transport in Scotland. The outcomes tackle the problems and issues within the Scottish transport system, whilst also realising opportunities for economic improvement.

The LATIS modelling capability was used extensively throughout the study to compare and contrast a wide range of surface transport interventions.

The findings of the study were reported in late 2008 and outlined a range of long-term strategic commitments to improve Scotland's land-based transport infrastructure.

The schemes identified ranged from major road and rail schemes to measures such as improved road safety and integrated ticketing.

The role of LATIS on this project is now two-fold:

- to support any further required analysis on the outcomes of the process
- to support the delivery of the STPR outcomes

LATIS will be a particularly valuable tool in assessing the range of impacts associated with schemes of national significance. Outputs from the National Model can also be fed into more detailed regional/local models for more detailed scheme design and appraisal.
